Metformin 500/850 mg tablets

First choice in the treatment of type 2 diabetes mellitus, particularly in obese patients.

2018

Metformin continues to be the **first-line** recommended therapy for almost **all patients** with type 2 diabetes.

-*Diabetologia, Diabetes Care*, and presented at the October, 2018 Annual Meeting of the EASD (European Association for the Study of Diabetes).

- Improves glycaemic control in T2D
- Lowers HbA<sub>1c</sub> level
- Counters insulin resistance
- Reduces fasting hyperinsulinaemia
- Facilitates reduction of excess adiposity
- Modestly improves blood lipid profile
- No significant effect on blood pressure
- Helps prevent progression of IGT/ IFG ('prediabetes') to type 2 diabetes
- Good response as monotherapy or in combination

**First Choice in PCOS**

*"Infertility is a common issue faced by women with PCOS, most often attributed to anovulation."*<sup>1</sup>

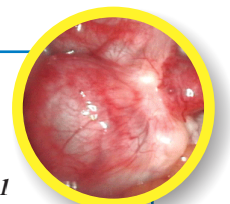

*"Insulin resistance (IR) and secondary hyperinsulinemia affect approximately 65-70% of women with PCOS."*<sup>2,3</sup>
